

Installation guide for Trackunit Temperature Package

1 I/O connections: General I/O

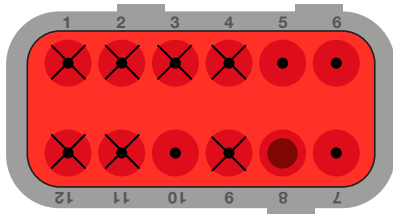

To ensure proper data collection in ME50X-4, it is important that the general I/O signals are mounted.

| | I/O cable | Machine | Function |
|-----------------|-----------|-----------------|-----------------|
| Power | Red | Power | 12V/24V |
| Ground | Blue | Ground | Ground |
| Input 1 | White | Engine signal | Operational hrs |
| Input 2 | Brown | Ignition signal | Ignition status |
| Input 3 | Grey | General purpose | |
| Input 4 | Pink | General purpose | |
| Output 1 | Yellow | General purpose | |

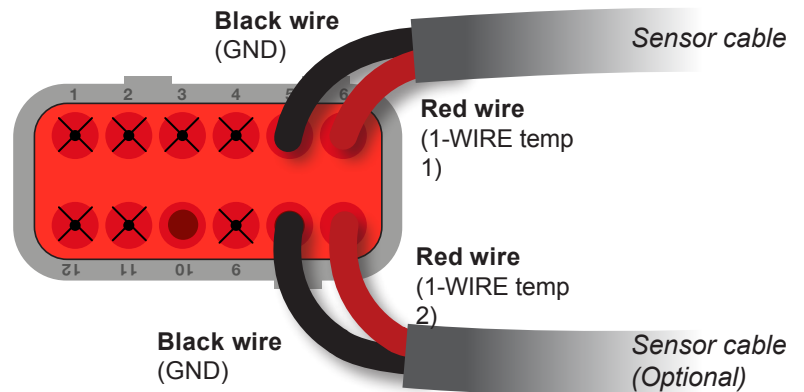

An external fuse must be mounted between the battery power supply and the ME50X – as close as possible to the battery. Fuse-kit is enclosed.

2 Connecting the temperature sensor

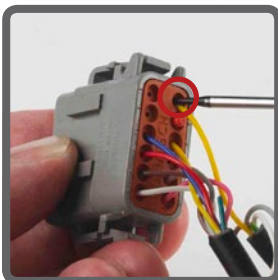

Premounted wires =
X Sealing plug ●

Temperature sensor connections:

Connector assembly

Step 1: Use appropriate tool to push contact straight into the connector grommet until a CLICK is felt.

Step 2: Put the connector into back shell. Insert strips for fixing the wires inside the connector. Cut off unnecessary strip.

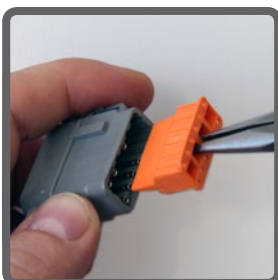

Step 3: Close the connector back shell properly until a CLICK is heard. Avoid squeezing wires.

Step 4: Once all necessary contacts are in place, insert orange wedge until it snaps into place.

Connector removal

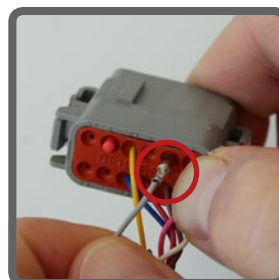

Trouble shooting: Sensor replacement

Step 1: Remove orange wedge by pulling it straight out using appropriate tool.

Step 2: Remove contacts with a gentle pull while at the same time releasing the locking finger with a screwdriver.

Step 3: Hold the seal in place with your finger, while pulling out the contact.
